## A Same observed answer; different local clause fidelity

Retained observation: reference condition, Kestrel test item, choice = admit

Query: owned = true, public = false; supplied mapping requires admit

**Recorded rule: block 0**

**Local constraint: DEFER**

Final choice: ADMIT

Local clause conflicts with mapping

**Recorded rule: block 3**

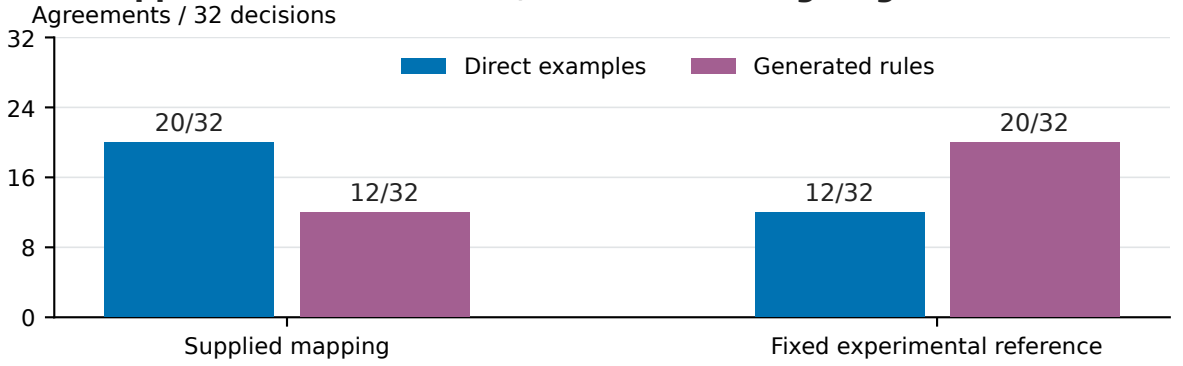
**Local constraint: ADMIT**

Final choice: ADMIT

Local clause matches mapping

Rule text, block and seed are omitted by this observation projection.

## B Same flipped-condition choices; different scoring targets



Complementary target labels account for the reversal; neither target authenticates authority.
